AMENDMENTS TO THE CLAIMS

1. (Currently Amended) A method for creating a library of pump data on a hand-held computer having a database, each pump program, the pump data being organized into sets of program data, each set of program data being available for batch downloading to a medical pump and including data items for controlling operation of the medical pump, the method comprising:  
  
entering a plurality of data items into a database on the hand-held computer, the plurality of data items forming a set of program data, at least some of the data items establishing patient-specific parameters for controlling operation of a medical pump; and  
  
assigning at least one data key to the set of program data, the data key identifying the set of program data;  
  
batch-down loading the plurality of data items into memory within the pump; and  
controlling operation of the pump based on one or more of the data items.
2. (Original) The method of claim 1 wherein the acts of:  
  
entering a plurality of data items into a database includes entering the plurality of data items into a program data record in the database; and  
  
assigning at least one data key to the set of program data includes entering the data key into a data key record and linking the data key record to the program data record.
3. (Original) The method of claim 2 wherein the act of assigning at least one data key to the set of program data further includes: entering an identification code selected from the group consisting essentially of a patient I.D., a therapy I.D., and a fluid I.D.,

S/N 09/920,467

PATENT

wherein the patient I.D. is a code identifying a patient, the therapy I.D. is a code identifying a therapy administered using a medical pump, and the fluid I.D. is a code identifying a fluid that is administered using a medical pump.

4. (Previously Amended) The method of claim 3 wherein the hand-held computer is in data communication with a scanner, the method further comprising:

scanning a bar code with the scanner; and

entering the bar code into the hand-held computer,

wherein the act of assigning at least one data key to the set of program data

includes assigning the bar code to the set of program data.

5. (Previously Amended) The method of claim 3 wherein the hand-held computer is in data communication with a medical pump, the method further comprising uploading a set of program data items from the pump.

6. (Previously Amended) A computer storage medium on a hand-held computer containing a library of pump data, the computer storage medium being created by the method set forth in claim 1.

7. (Currently Amended) An apparatus for maintaining a library of program data for medical pumps having memory, the apparatus comprising:

housing having a hand-held form factor;

memory positioned within the housing and loaded with a database, the database

including a plurality of program data records and a plurality of data key

records, each program data record containing a set of program data items,

at least some of the program data items included in the database being

patient-specific for controlling operation of a medical pump, each data key

S/N 09/920,467

PATENT

record containing a data key and each data key identifying one of the data program records;

a database management system programmed to link a data key to a set of program data and to batch download data to the memory within the medical pump.

8. (Original) The apparatus of claim 7 further comprising a scanner in data communication with the database management system, the database management system being further programmed to receive a code scanned by the scanner, save the code in a data key record, and link the code to a set of program data, the code being a data key.

9. (Original) The apparatus of claim 7 further comprising a medical pump, the medical pump storing a set of program data, the database management system being further programmed to receive the set of program data from the medical pump and save the set of program data as a record in the database.

10. (Currently Amended) An apparatus for batch programming a medical pump having memory, the apparatus comprising:

a housing having a hand-held form factor;

memory positioned within the housing and loaded with a database, the database including a plurality of program data records and a plurality of data key records, each program data record containing a set of program data items, at least some of the program data items included in the database being patient-specific and for controlling operation of a medical pump, each data key record containing a data key and each data key identifying one of the data program records;

S/N 09/920,467

PATENT

a data output configured for data communication with a programmable medical pump; and

a processor in electrical communication with the memory and the data output, the processor configured to retrieve a set of program data from the database and batch download the set of program data to the memory within the medical pump.

11. (Original) The apparatus of claim 10 further comprising a serial communication cable connected to the data output.
12. (Original) The apparatus of claim 10 further comprising a medical pump in data communication with the data output.
13. (Original) The apparatus of claim 10 wherein each data key record includes first and second fields, the first field for storing an identification code and the second field from storing a name in prose.
14. (Original) The apparatus of claim 10 wherein each data key record includes fields for a patient I.D., a therapy I.D., and a fluid I.D.
15. (Original) The apparatus of claim 10 wherein the processor is programmed: to generate a user interface, the user interface including a plurality of graphical fields for program data and to permit.
16. (Currently Amended) A method for batch programming a medical pump having memory, the method comprising:

selecting a set of program data stored on a hand-held computer, the set of program data including patient-specific data items for controlling operation of a medical pump; and

S/N 09/920,467

PATENT

batch downloading the set of program data from the hand-held computer to the memory within the medical pump, wherein the set of program data is downloaded to the medical pump without intervening action by a user after the first data item is downloaded to the hand-held computer.

17. (Currently Amended) The method of claim 16 wherein an information management system is loaded on the a hand-held computer and the information management system includes a database storing a plurality of data keys and a plurality of program data sets, and wherein the act of selecting a set of program data comprises:

entering a data key into the information management system;  
referencing the data key to a program data set; and  
and retrieving the referenced program data set from the database.

18. (Original) The method of claim 17 wherein the act of entering a data key includes scanning a bar code.

19. (Previously Amended) The method of claim 16 wherein an information management system is loaded on a hand-held computer and the information management system includes a database storing a plurality of data keys and a plurality of program data sets and the act of batch downloading the set of program data includes downloading the set of program data from the hand-held computer to the medical pump, the method further comprising:

uploading the set of program data from the medical pump to the hand-held computer after it is downloaded to the medical pump;  
comparing the set of program data that was download to the medical pump to the set of program data that was uploaded from the medical pump; and

S/N 09/920,467

PATENT

generating an error if the set of program data that was downloaded from the  
medical pump is not identical to the program data that was uploaded from  
the medical pump.

20. (Original) A propagated signal on a carrier detectable by a computing system and  
encoding a set of program data for controlling operation of a medical pump, the  
propagated signal being encoded according to the method of claim 16.
